

Frontend Developer Assessment Task

Objective

Build a ToDo list dashboard using React OR Next.js with 4 columns (e.g., Backlog, In Progress, Review, Done).

Frontend Challenge (2–3 Hours)

Tech: (React + Zustand or Redux) OR Next.js Use React Query for both

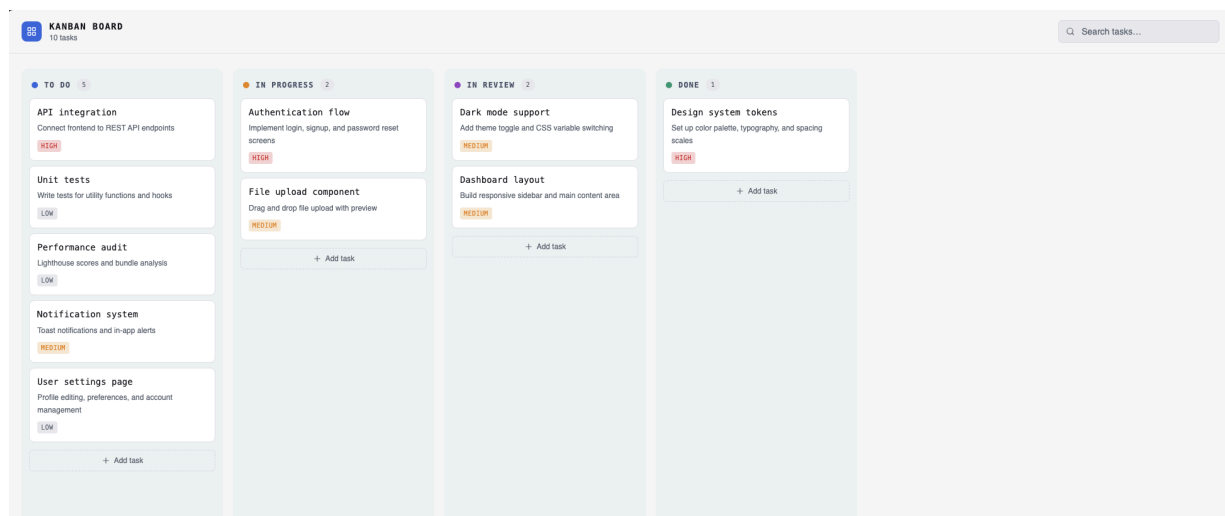

Task: Create a Kanban-style ToDo list application.

Each task should contain the following fields:

- title
- description
- column (backlog, in_progress, review, done)

Requirements:

- Display tasks across 4 columns
- Create, update, and delete tasks
- Drag-and-drop tasks between columns
- Pagination or infinite scroll in each column
- Search bar to filter tasks by title or description
- Use Material UI or Bootstrap for layout and components
- Cache data using React Query

Shared API or Local Mock

You can use one of the following methods to mock your API:

Option 1 – Local Mock API with json-server:

1. Install json-server: `npm install -g json-server`

2. Create db.json:

```
{
  "tasks": [
    {
      "id": 1,
      "title": "Design homepage",
      "description": "Include hero section",
      "column": "backlog"
    }
  ]
}
```

3. Run server: `json-server --watch db.json --port 4000`

4. Access via: <http://localhost:4000/tasks>

Submission

All source code and deliverables should be submitted via a public or private GitHub repository.

The repository must include:

- README file with setup instructions
- Source code of the application
- Deployment link (if applicable) is a big plus to be on live server
- Clearly structured code with comments where needed

Please ensure the repository is accessible to reviewers.
