

SESSION 1 — CONTENT REVIEW REPORT

HTML Basics & Document Structure

Topic from Official Outline	In Slides?	Status
What HTML is and how it works in the browser	Yes	✓ Complete
Relationship between code and what the user sees	Yes	✓ Complete
HTML document anatomy: DOCTYPE, html, head, body	Yes	✓ Complete
Head element: title, meta charset, meta viewport, link tag	Yes	✓ Complete
Headings h1–h6 and paragraphs	Yes	✓ Complete
HTML comments	Yes	✓ Complete
Elements and attributes (tag, class, ID)	Yes	✓ Complete
Text formatting: bold, italic, underline, strikethrough	Yes	⚠ Incomplete
Semantic vs. presentational usage of formatting tags	Partial	✗ Missing
The div container + when to prefer semantic alternatives	Partial	⚠ Incomplete
Lab Activity	Yes	⚠ Incomplete
Take-home Assignment	Yes	✓ Complete

Detailed Issues

Issue 1 — Missing: Semantic vs. Presentational Explanation High Priority

The official content outline explicitly requires the instructor to explain the difference between semantic and presentational usage of text formatting tags.

What the outline requires:

- Explain that `<strong>` and `<em>` carry semantic meaning (importance, emphasis).
- Explain that `<b>` and `<i>` are purely visual with no semantic weight.
- Emphasize that developers should choose based on meaning, not just appearance.

What the slides currently show:

- Slide 10 briefly lists `<strong>` and `<em>` alongside `<p>` with a note to 'focus on meaning.'
- Slide 11 shows `<b>`, `<i>`, `<u>`, `<s>` without any comparison or explanation of when to use which.
- No distinction between semantic and presentational tags is made.

Recommended fix:

- Add a dedicated comparison showing `<strong>` vs `<b>` and `<em>` vs `<i>` side by side with explanation.

Issue 2 — Incomplete: How Block & Inline Elements Interact

Recommended fix:

- Add a live code example or annotated diagram showing stacking and flow behavior.

Issue 3 — Incomplete: Div Container & Semantic Alternatives

The outline requires coverage of when to use `<div>` and when to prefer semantic alternatives. The current slides present `<div>` as a generic container without any guidance on alternatives.

What is missing:

- No mention of semantic HTML elements such as `<section>`, `<article>`, `<header>`, `<footer>`, or `<main>`.
- No guidance on when `<div>` is appropriate vs. when a semantic tag would be better.

Recommended fix:

- Add a brief comparison table or examples showing `<div>` vs. semantic alternatives.
- Keep it introductory since full semantic HTML may be covered in a later session.

Issue 4 — Lab Activity Lacks Required Details

The current Lab Activity slide only says 'Recreate a webpage structure from a reference image.' The official outline specifies clear requirements for this activity.

What the outline requires:

- Reference image must contain: a header title, three sections with headings and paragraphs, and a short footer note.
- Students must choose the correct heading levels.
- Students must use div containers where appropriate.
- Students must include at least three HTML comments explaining their structure choices.

Recommended fix:

- Update the Lab Activity slide to display these requirements clearly for students.
- Ensure the reference image is included in or distributed with the session materials.

Issue 5 — Typos in Slides Low Priority

Two typos were found in the current slides:

- Slide 10: 'The elemnt' should be 'The element'.
 - Slide 11: Slide title reads 'TEXT FORMATTIN' — missing the final letter 'G'.
-
